COUNCIL FOR
SUSTAINABLE
ENERGY

UNFCCC - Formal Intervention
12 December 2009

International Council for Sustainable Energy Global Wind Energy Council

Madam Chair and distinguished delegates, thank you for the opportunity to present our views to the meeting.

I am speaking on behalf of business and industry NGOs, representing the views of the International Council for Sustainable Energy and the Global Wind Energy Council. We are a group of clean energy companies and business organizations worldwide representing the renewable energy, energy efficiency and natural gas industries.

Collectively, we represent companies with billions of dollars in financial capital and investments, and a strong commercial interest in the expansion of existing clean energy technology markets as well as effective carbon markets that contribute to reductions in greenhouse gas emissions.

We support a strong Copenhagen accord with clear mid-term and long-term policy signals for developed countries and clarity on national policies and actions in major emitting developing countries.

This is needed to more rapidly diffuse existing clean energy technologies, build more efficient buildings and energy infrastructure, and direct investment to develop and commercialize new technologies.

The development and transfer of mitigation and adaptation technologies are essential to addressing the climate change challenge. We acknowledge that this is a joint effort between developed and developing countries, which will provide benefits for all participants.

We offer the following views on technology and financing outcomes in Copenhagen:

- The private sector will play a significant role in the development, transfer and financing of mitigation and adaptation technologies. Therefore, new technology and financing frameworks must be structured to attract and leverage public and private capital flows and protect intellectual property rights. Further, the private sector should be involved in the design, governance and implementation of technology and financing initiatives.
- Proposals to actively engage the private sector, such as those envisioned under an appropriately structured Consultative Network for Climate Technology (CoNECT), are critical to success.
- Enabling environments are critical to the development, deployment and diffusion of technology. Indicators for enabling environments should be simple, specific and track incentives and policies to increase installed capacity of clean energy generation as well as the adoption of codes, standards and policies to increase efficiency in new and existing buildings.
- It is important that new technology and financing structures deliver results. We support capacity building initiatives that enable credible measurement, monitoring and reporting systems.

Thank you, Madam Chair.

The ICSE intervention was delivered by Clay Nesler, Vice President for Global Energy and Sustainability at Johnson Controls.
